Week 1 Quiz

1. If I want to view the history of my training, how can I access it? **1 / 1 point**

- Download the model and inspect it
- Use model.fit to train the model
- Create a variable 'history' and assign it to the return of model.fit
- Pass the parameter 'history=true' to model.fit

Correct
Exactly! The History.history attribute is a record of training loss values and metrics values at successive epochs.

2. If my image is sized 150x150, and I pass a 3x3 convolution over it, what size is the resulting image? Assume you're using the default settings of the Conv2D layer just like in the lectures. **1 / 1 point**

- 153x153
- 148x148
- 150x150
- 450x450

Correct
Nailed it! Applying a 3x3 convolution would result in a 148x148 image.

3. What does the image_dataset_from_directory utility allow you to do? Select the best answer. **1 / 1 point**

- The ability to easily load images for training
- The ability to pick the size of training images
- The ability to automatically label images based on their directory name
- All of the above

Correct
That's right! It can do all the things mentioned above.

4. When exploring the graphs, the validation accuracy leveled out at about .75 after 2 epochs, but the training accuracy climbed close to 1.0 after 15 epochs. What's the significance of this? **1 / 1 point**

- There was no point training after 2 epochs, as we overfit to the validation data
- There was no point training after 2 epochs, as we overfit to the training data
- A bigger training set would give us better training accuracy
- A bigger validation set would give us better training accuracy

Correct
Correct! Those values indicate overfitting to the training data.

5. If my data is sized 150x150, and I use Pooling of size 2x2, what size will the resulting image be? **1 / 1 point**

- 149x149
- 300x300
- 148x148
- 75x75

Correct
Nailed it! Applying 2x2 pooling would result in a 75x75 image.

6. What's the name of the API that allows you to inspect the impact of convolutions on the images? **1 / 1 point**

- The model.layers API
- The model.images API
- The model.convolutions API
- The model.pools API

Correct

7. Suppose you want to evaluate a model's performance on unseen data. Why is validation accuracy a better **1 / 1 point**
